DNA vaccine containing plasmid and cationic lipid containing quaternary ammonium salt, useful for protecting pets and sports animals against, e.g. herpes virus.

Example 10; Fig 26; 109pp; French.

The invention relates to a novel DNA vaccine against pathogens that affect pets and sports animals comprises a plasmid containing a sequence, expressible in vivo, that encodes an immunogen from the relevant pathogen and a cationic lipid containing a quaternary ammonium salt, particularly N-(2-hydroxyethyl)-N,N-dimethyl-2,3-bis(tetradecyloxy)-1-propanammonium (DMRIE). The immunogens are particularly taken from canine distemper

```
virus (CDV), canine parainfluenza virus type 2 (CPI-2), canine herpes virus (CHV), feline herpes virus type 1 (FHV-1), equine herpes virus type 1 (EHV-1), and EHV type EHV-4). The method may also include the use of a immunogenic stimulation factor especially a granulocyte-macrophage colony stimulation factor especially a granulocyte-macrophage. The vaccines, which may be multivalent, are particularly used to protect dogs, cats and horses against bacterial and viral diseases, particularly those caused by the Paramyxoviridae. Formulations with the quaternary protection, particularly when administered subcutaneously. This sequence represents an equine GM-CSF used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

This sequence represents a horse granulocyte-macrophage colony stimulating factor (GM-CSF). The corresponding gene was isolated from horse lymphocytes using a reverse transcriptase PCR method with primers AAF28954-AAF28960. The protein has been shown to have at least 75%

```
colony formation in various types of blood cells and particularly induces colony formation in various types of blood cells and particularly induces cytotoxicity of macrophages; stimulates antibody-dependent cytotoxicity, and causes recruitment of leucocytes to sites of inflammation. Vectors containing the gene or the protein itself, are useful as adjuvants in amunogenic or vaccinating compositions for horses, e.g. for protection against equine herpes, tetanus, Borrelia burgdorferi, rabies etc. Also as non-specific stimulators of the immune system. In a specific example, containing the sequence for equine GM-CSF was used to transform GD-KI cells and the transformants grown for 48 hours. The culture supernatant was then added to culture medium being used to grow porcine bone marrow cells. After 14 days, the mean number of colonies per culture box was 12-15, compared with none for cells grown in absence of GM-CSF. Equine GM-CSF allows a reduction in the amount of immunogenic/vaccinating component required, and may induce a response in

The sequence is that of a porcine cytokine designated chimerism enhancing factor (CHEP-2). The cytokine can be used for improving engrafment, stabilisation and proliferation of tissues, esp. bane marrow cells, in xenogeneic transplantation. The cytokine may be used to prevent or treat various swine diseases, e.g. African swine fever, Hog cholera, pseudorabies, etc. See also AAST4817-9. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)
                      Porcine cytokine Chimerism Enhancing Factors (CHEFS) and DNA - used to enhance xenograft tolerance.

                                                                  The sequence is that of the ovine granulocyte-macrophage colony stimulating factor (GM-CSF), a cytokine-like molecule. The ovine cytokines will be useful in the intensive livestock industries such as live animal export trade, feed-lots and intensive rearing industries, where animals are subjected to great environmental challenge with infectious diseases, partic. respiratory infections, and are more prone to immunodepressive effects. The cytokines may be used for treatment or prophylaxis to maintain, stimulate or enhance immunoresponsiveness. They may also be useful as natural adjuvants for vaccines for sheep and cattle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A recombinant DNA molecule encoding a hGM-CSF is claimed wherein there is a 5' terminal alteration allowing higher yield than the native DNA sequence. The cpds. may be used to reduce the likelihood of infections in immunologically compromised individuals, such as those suffering from AIDS by increasing their white blood cell count
                                                                                                                                                                                   120
                                                                                                                                                                                               Sequencu of a human granulocyte-macrophage colony stimulating factor (hGM-CSF)-like polypeptide isolated from 5637 cell line.
                                                                                                                                         9
                                                                                                                                                              9
administration to enhance natural defences against neoplastic and infectious diseases or as an adjunct in chemotherapy to overcome myelosuppression. GM-CSF is prepared by conventional recombinant DNA techniques. The factor has activity on human neutrophilic granulocytes, macrophages and eosinophils. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PP field.)

This sequence represents human granulocyte-macrophage colony stimulating factor (GM-CSF). Heterogeneity of the nucleotide sequence and the amino acid sequence has been observed and this sequence was deposited in E. coli as ATCC 39923. The GM-CSF protein was isolated using the method of the invention. The method comprises killing and disrupting GM-CSF-expressing bacteria and preparing a GM-CSF containing extract from the disrupted cells. This extract is subjected to quaternary amino ethyl (GAB) anion exchange chromatography to separate proteases and produce protease-free GM-CSF fractions. These fractions are subjected to red 120 triazinyl dyeligated affinity chromatography to obtain GM-CSF containing fractions. Free of hydrophobic impurities. These fractions are then subjected to gel filtration column chromatography to produce GM-CSF containing fractions free of high and low mol. wt. impurities which are then subjected to gel reversed-phase column chromatography to produce fractions with a purity of greater than 95%. The obtained GM-CSF may be used in clinical situations where the stimulation of blood cell generation is desirable.
                                                                                                                                                                                                       Human; granulocyte-macrophage colony stimulating factor; GM-CSF; E.coli; quaternary amino ethyl anion exchange chromatography; red 120 triazinyl dye-ligand affinity chromatography; gel filtration column chromatography; stimulation; blood cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Purifying granulocyte-macrophage colony-stimulating factor - by anion-
exchange, dye-ligand affinity, gel filtration and reversed-phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This represents the human granulocyte macrophage colony stimulating factor (GM-CSF). A murine GM-CSF which is similar to the human GM-CSF is used for generating a recombinant poxvirus. The recombinant poxvirus comprises a nucleic acid sequence encoding a biological response modifier or its immunomodulating fragment in a non-essential region of the recombinant virus genome. The biological response modifier may be a cytokine, e.g. interlekin-12 (IL-12), IL-2 or GM-CSF. The recombinant poxvirus is used to transfect cells for expression of the biological response modifier. The products are useful for the treatment of tumours or for protecting a host against tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SETFDAEBLICLOTRLKLYKOGLRGSLIKLEGPLTMMASHYKOHCPPTLETSCATOMITF 120

The present sequence represents part of a human GMCSF protein. It is used to produce fusion proteins with a human zalphall ligand. Zalphall ligand is a cytokine. The zalphall ligand is useful for stimulating the proliferation and development of hematopoietic cells in vitro and in vivo. Zalphall ligand polynucleotides can be used as primers or probes or cloning the zalphall gene. The zalphall ligand is useful for treating the zalphall ligand-saporin fusion toxin may be used for treating leukaemias and lymphomas. Antagonists against zalphall ligand are useful as research reagents for characterizing ligand-receptor interaction, Antagonists are also useful for inhibiting expansion, proliferation, activation and differentiation of cells involved in regulating hematopoiesis. The zalphall ligand may also be used to stimulate an immune response against B cell tumour, a virus, a parasite or a bacterium. The zalphall polypeptides, polynucleotides, antagonists, agonists and antibodies are also useful for the detection, diagnosis, prevention, and treatment of diseases associated with a zalphall ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 SETFDABELITCLOTRIKLYKQGLRGSLIKLEGPLTWMASHYKQHCPPTLETSCATQMITF 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human cytokine, designated zalphall ligand, useful for stimulating the proliferation and/or development of hematopoietic cells in vitro and in vivo, and for treating tumorigenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
zalphall ligand, cytokine, haematopoietic cell proliferation, lymphoma, tumourigenesis; leukaemia, hematopoiesis; B cell tumour; GMCSF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MWLQNLLLLGTVVYSMPAPTRQPSPVTRPWQHVDAIKEALSLLNNSSDTAAIMNETVEVV

The present sequence is given in a specification relating to polynucleotide and polypeptide molecules for mammalian secreted alpha helical protein-31 (zalpha31). The polypeptides are a novel four-helixx bundle cytokine and may be used to regulate the functioning of the immune system. The polypeptides are used to identify and isolate receptors involved in spermatogenesis, steroidogenesis, testicular differentiation and regulatory control of the hypothalamic-pituitary gonadal axis, thyroid, heart and adrenal function. They are useful for treating disorders of the reproductive system, thyroid, adrenal, heart and immune continuous systems. Zalpha31 polypeptides, or antagonists are useful in the treatment of e.g. osteoprosis, paget's disease, and hyperparathyroidism, acute pancreatitis and gastrointestinal disorders and as analgesics, especially for bone pain. They can be used to treat atherosclerosis, pelvic inflammatory disease, (PID), psoriasis, atherosclerosis, pelvic inflammatory disease. (PID), psoriasis, atheritis, eczema, scleroderma and other inflammatory diseases. The polypeptides, nucleic acids and/or antibodies can be used to treat heart transplantation, treat complications related to poor circulation e.g. diabetic foot ulcers, treat stroke, improve cardiac function, induce skeletal muscle neogenesis and/or hyperplasia, be used in kidney regeneration and/or for treating vistemic and pulmonary hypertension. Zalpha31 can be used for treating viral leukaemias, heart attach immunodeficiency syndrome (AIDS) or gastrointestinal viral
                                                                                                            granulocyte-macrophage colony simulating factor; GM-CSF; cytostatic; antiinflammatory; antiarthritic; antirheumatoid; immunosuppressive; antiasthmatic; antibacterial; osteopathic; antiatherosclerotic; antipsoriatic; dermatological; anti-HIV; gene therapy; osteoporosis; Paget's disease; hyperparathytordism; acute panoreatitis; gastrointestinal disorder; inflammation; heart disorder; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel 4-helix bundle cytokine, Zalpha31, useful for regulating the function of immune system and for treating thyroid, adrenal, lymphoid, inflammatory; pancreatic, blood or bone disorders.
                                                                                         Human; zalpha31; alpha helical protein-31;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 107-108; 111pp; English.

The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibites the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PDGF), fibroblast growth factor (EGF), connective tissue derived growth factor (EGF), factor (EGF), connective factor (EGF), ransforming growth factor (EGF), expidermal growth factor (EGF), vacular endothalial growth factor (VEGF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of urokinase-type plasminogen activator the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers. The present sequence represents a human GM-CSF, and is used to produce the composition of the invention

                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for producing human granulocyte macrophage colony stimulating factor (hGM-CSF), where hGM-CSF having higher activity is easily purified. The method comprises: (a) preparing a fusion gene construct which contains a human origin glycoprotein gene linked with a bladder specific promoter, uroplakin II; (b) microinjecting the fusion gene construct into a fertilised egg; (c) transplanting the egg containing the fusion gene construct (KCTC 0723BP) into a surrogate mother; (d) producing a transformed animal from the surrogate mother; and help present inequence represents hGM-CSF which is referred to using the Genbank accession number X03021 in the exemplification of the present invention. N.B. The present is not given in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

The present integrated and the polymucleotide encoding it. The invention also gives the sequence for the zalphall receptor and the polymucleotide encoding it. The zalphall Ligand polypetide stimulates proliferation of natural killer (NK) cells or NK cells progenitors, the activation of NK cells, proliferation of T-cells, proliferation of B-cells stimulated with anti-CD40 antibodies, stimulates an antigenic response in a mammal, and reduces proliferation of B-cells stimulated with anti-IgM antibodies. The zalphall Ligand polypetide is also useful in preparing antibodies that bind to calphall Ligand epitopes. The zalphall Ligand polymucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence representing human GM-CSF (granulocyte macrophage-colony stimulating factor) polypetide can be used to create fusion proteins containing the near the human zalphall Ligand polypetide and from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New zalphall ligand polypeptides and polynucleotides, useful for
stimulating proliferation, activation, differentiation and/or induction
of inhibition of specialized cell function, or for stimulating an

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 12, P

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 448, A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                          The invention relates to a novel DNA vaccine against pathogens that affect pets and sports animals comprises a plasmid containing a sequence, expressible in vivo, that encodes an immunogen from the relevant pathogen and a cationic lipid containing a quaternary ammonium salt, particularly No.(2-hydroxypethyl)-N.N-dimethyl-2,3-bis(tetradecyloxy)-1-propanammonium (DMRIE). The immunogens are particularly taken from canine distemper virus (CDV), canine parainfluenza virus type 1 (FMV-1), equine herpes virus type 1 (EHV-1), equine herpes virus type 1 (EHV-1), and EHV type 4 (EHV-4). The method may also include the use of a immunogenic stimulation factor especially a granulocyte-macrophage colony stimulation factor especially a granulocyte-macrophage for which may be multivalent, are particularly used to protect dogs, cate and horses against bacterial and viral diseases, particularly those caused by the paramyxoviridae. Formulations with the quaternary
                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                    120

This sequence represents the gene encoding a horse granulocyte-macrophage colony stimulating factor (GM-CSF). The gene was isolated from horse lymphocytes using a reverse transcriptase PCR method with primers ARF28960. GM-CSF induces colony formation in various types of blood cells and particularly induces cytotoxicity of macrophages; cimilates antibody-dependent cytotoxicity, and causes recruitment of leucocytes to sites of inflammation. Vettors containing the gene or the protein itself, are useful as adjuvants in immunogenic or vaccinating compositions for horses, e.g. for protection against equine herpes, tetanus, Borrelia burgdorferi, rables etc. Also as non-specific stimulators of the immune system. In a specific example, plasmid pJP097, containing the sequence for equine GM-CSF was used to transform CHO-K1 cells and the transformants grown for the burse the culture supernatant was then added to culture medium being used to grow porcine bone marrow cells. After 14 days, the mean number of colonies per culture box was 12-15, compared with none for cells grown in absence of GM-CSF. Equine GM-CSF allows a reduction in the amount of immunogenic/vaccinating component required, and may induce a response in enimals that would otherwise be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CGCCAACCCAGCCCTGTCACTCGGCCCTGGCATGTGGATGCCATCAAGGAGGCCCTG 120
